Isomorphism classes of complex tori

We have seen in the first lecture that to any lattice $\Lambda \subset \mathbb{C}$ we can associate a complex tori defined as \mathbb{C}/Λ .

Question

When two distinct lattice Λ_1 and Λ_2 give rise to isomorphic complex tori $\mathbb{C}/\Lambda_1 \cong \mathbb{C}/\Lambda_2$?

Definition

Two lattice Λ_1 and Λ_2 are said to be **homothetic** if there exists $\alpha \in \mathbb{C}$ such that $\alpha\Lambda_1 = \Lambda_2$

If α is such that $\alpha\Lambda_1 \subseteq \Lambda_2$, then we can define a surjective map $\phi_\alpha : \mathbb{C}/\Lambda_1 \rightarrow \mathbb{C}/\Lambda_2$, by setting

$$\phi_\alpha([z]_{\Lambda_1}) = [\alpha z]_{\Lambda_2}.$$

It can be shown that this is a holomorphic map. Moreover if $\alpha\Lambda_1 = \Lambda_2$ then ϕ_α is an isomorphism.

Isomorphism classes of complex tori

Consider the association

$$\{\alpha \in \mathbb{C} : \alpha\Lambda_1 \subseteq \Lambda_2\} \rightarrow \left\{ \frac{\mathbb{C}}{\Lambda_1} \xrightarrow{\phi} \frac{\mathbb{C}}{\Lambda_2} : \phi(0) = 0 \text{ and } \phi \text{ holomorphic} \right\}$$
$$\alpha \mapsto \phi_\alpha$$

Theorem

Let Λ_1 and Λ_2 be two lattices. Then the above association is a bijection. Moreover \mathbb{C}/Λ_1 and \mathbb{C}/Λ_2 are isomorphic if and only if Λ_1 and Λ_2 are homothetic.

Let

$$\mathcal{L} = \{\Lambda \subset \mathbb{C} : \Lambda \text{ is a lattice}\}$$

We have an action of \mathbb{C}^* on \mathcal{L}

$$\begin{aligned}\mathbb{C}^* \times \mathcal{L} &\longrightarrow \mathcal{L} \\ (\alpha, \Lambda) &\longmapsto \alpha\Lambda\end{aligned}$$

Let $\Lambda_0 \in \mathcal{L}$ the **orbit** of Λ_0 under \mathbb{C}^* is the set

$$\text{Orb}_{\mathbb{C}^*}(\Lambda_0) = \{\Lambda \in \mathcal{L} : \Lambda = \alpha\Lambda_0\}$$

The set of orbits is usually denoted by \mathcal{L}/\mathbb{C}^* . Since two complex tori are isomorphic if and only if the associated lattices are homothetic we have that there exists a bijection

$$\mathcal{L}/\mathbb{C}^* \longrightarrow \{\text{isomorphism classes of complex tori}\}$$

So we want to understand better what \mathcal{L}/\mathbb{C}^* looks like.

Lemma

Every lattice is homothetic to a lattice of the form $\mathbb{Z} + \tau\mathbb{Z}$ with $\text{Im}(\tau) > 0$.

Let

$$\mathfrak{h} = \{z \in \mathbb{C} : \text{Im}(z) > 0\}$$

denote the upper half plane. Then, as consequence of the previous lemma, we have that the map

$$\begin{aligned}\mathfrak{h} &\longrightarrow \mathcal{L}/\mathbb{C}^* \\ \tau &\longmapsto [\Lambda_\tau]\end{aligned}$$

is surjective. Unfortunately is not injective.

We have to consider another action to actually get a set of representative for the set of orbits. First of all recall that $\text{Mat}_{2 \times 2}(\mathbb{R})$ acts on \mathfrak{h} by fractional linear transformation, which means that given $\gamma = \begin{pmatrix} a & b \\ c & d \end{pmatrix}$ we let

$$\gamma \cdot z = \frac{az + b}{cz + d}$$

Lemma

If $\text{Im}(\tau) \neq 0$, then

$$\text{Im} \left(\frac{az + b}{cz + d} \right) = \frac{(ad - bc)}{|cz + d|^2} \text{Im}(z)$$

Let

$$\mathrm{SL}_2(\mathbb{Z}) = \left\{ \begin{pmatrix} a & b \\ c & d \end{pmatrix} \in \mathrm{Mat}_{2 \times 2}(\mathbb{Z}) : ad - bc = 1 \right\}.$$

$\mathrm{SL}_2(\mathbb{Z})$ is called the modular group and often denote by $\Gamma(1)$. By the above lemma $\mathrm{SL}_2(\mathbb{Z})$ act on \mathbb{C} by fractional linear transformation:

$$\begin{aligned} \mathrm{SL}_2(\mathbb{Z}) \times \mathfrak{h} &\longrightarrow \mathfrak{h} \\ \left(\gamma = \begin{pmatrix} a & b \\ c & d \end{pmatrix}, \tau \right) &\longmapsto \gamma(\tau) = \frac{a\tau + b}{c\tau + d} \end{aligned}$$

Clearly $-I = \begin{pmatrix} -1 & 0 \\ 0 & -1 \end{pmatrix}$ acts like the identity. Thus we get an action of the quotient group $\overline{\Gamma(1)}$ on \mathfrak{h}

Lemma

The lattices Λ_{τ_1} and Λ_{τ_2} , ($\tau_1, \tau_2 \in \mathfrak{h}$), are homothetic if and only if there exist $\gamma \in \Gamma(1)$ such that $\gamma(\tau_1) = \tau_2$.

Thus to understand \mathcal{L}/\mathbb{C}^* we only need to compute a fundamental domain for the action of $\Gamma(1)$ on \mathfrak{h}

Recall that \mathcal{F} is a fundamental domain for the action of the modular group $\Gamma(1)$ if the following condition holds: each orbit intersect \mathcal{F} in exactly one point.

A fundamental domain

Let

$$\tilde{\mathcal{F}} = \left\{ \tau \in \mathfrak{h} : |\tau| \geq 1 \text{ and } -\frac{1}{2} \leq \operatorname{Re}(\tau) \leq \frac{1}{2} \right\}$$

where $\rho = \exp\left(\frac{2\pi i}{3}\right)$

Matrices in $\Gamma(1)$

$$T = \begin{pmatrix} 1 & 1 \\ 0 & 1 \end{pmatrix} \quad S = \begin{pmatrix} 0 & -1 \\ 1 & 0 \end{pmatrix}$$

and their action is given by

$$T(\tau) = \tau + 1 \quad S(\tau) = -\frac{1}{\tau}$$

Note that $S^2 = I$. Moreover

$$(ST)^3 = \begin{pmatrix} 0 & -1 \\ 1 & 1 \end{pmatrix}^3 = \begin{pmatrix} -1 & 0 \\ 0 & -1 \end{pmatrix} = -I$$

and

$$(TS)^3 = \begin{pmatrix} 0 & -1 \\ 1 & 1 \end{pmatrix}^3 = \begin{pmatrix} -1 & 0 \\ 0 & -1 \end{pmatrix} = -I$$

So $(TS)^3 = I$ and $(ST)^3 = I$ in $\overline{\Gamma(1)}$.

Theorem

- (1) Given $\tau \in \mathfrak{h}$ then there exists $\gamma \in \Gamma(1)$ such that $\gamma(\tau) \in \tilde{\mathcal{F}}$
- (2) Given $\tau \in \tilde{\mathcal{F}}$ and $\gamma \in \Gamma(1)$, then $\gamma(\tau) \in \tilde{\mathcal{F}}$ if and only if one of the following situations occur:
 - (a) $\operatorname{Re}(\tau) = \frac{1}{2}$ and $\gamma(\tau) = \tau - 1$
 - (b) $\operatorname{Re}(\tau) = -\frac{1}{2}$ and $\gamma(\tau) = \tau + 1$
 - (c) $|\tau| = 1$ and $\gamma(\tau) = -\frac{1}{\tau}$
- (3) Given $\tau \in \mathfrak{h}$ let

$$\operatorname{Stab}_{\tau} = \left\{ \gamma \in \overline{\Gamma(1)} : \gamma(\tau) = \tau \right\}.$$

Then for $\tau \in \tilde{\mathcal{F}}$ we have

$$\operatorname{Stab}_{\tau} = \begin{cases} \langle S \rangle & \text{if } \tau = i \\ \langle ST \rangle & \text{if } \tau = \rho = \exp\left(\frac{2\pi i}{3}\right) \\ \langle TS \rangle & \text{if } \tau = -\bar{\rho} = \exp\left(\frac{\pi i}{3}\right) \\ I & \text{otherwise.} \end{cases}$$

Theorem

The group $\overline{\Gamma(1)}$ is generated by T and S .

The fundamental domain for the action of $\overline{\Gamma(1)}$ on \mathfrak{h} .
